Abstract

Abstract

ReWear is a web-based platform designed to promote sustainable fashion by enabling users to exchange, donate, and reuse pre-owned clothing. In today's consumer-driven society, many people discard clothes that are still usable, contributing to textile waste and environmental pollution. At the same time, others seek affordable clothing alternatives. The proposed platform addresses this challenge by providing a centralized digital solution that connects individuals who want to give away or exchange clothing items. Users can register, upload clothing listings with images and details such as category, size, condition, and availability, and browse items shared by other users. The system includes search and filtering capabilities to help users find suitable clothing, along with an exchange request mechanism that allows them to request items, propose exchanges, and track request statuses. An administrative dashboard enables the management of listings, reported content, and user activity to maintain a reliable platform. The web-based interface provides a simple and accessible experience for managing clothing listings and coordinating exchanges. By encouraging the reuse of existing clothing rather than its disposal, ReWear aims to reduce textile waste, support sustainable consumption, and make clothing more accessible to a wider community. The platform demonstrates the practical application of web development, database management, user authentication, and digital marketplace technologies while promoting environmental awareness and responsible resource utilization.
